COMMENTS:

See attached proposed amendments for Interview on Jan. 26, 2005 at 10:00 a.m. relating to U.S. Patent Appl. No. 10/047,204.

1397353.1

STATEMENT OF CONFIDENTIALITY

The documents included with this facsimile transmittal sheet contain information from the law firm of Nutter McClennen & Fish LLP which is confidential and/or privileged. The information is intended to be for the use of the addressee named on this transmittal sheet. If you are not the addressee, note that any disclosure, photocopying, distribution or use of the contents of this faxed information is prohibited. If you have received this facsimile in error, please notify us by telephone (collect) immediately so that we can arrange for the retrieval of the original documents at no cost to you.

IF THERE IS A PROBLEM WITH THIS TRANSMISSION, OR IF YOU DID NOT RECEIVE ALL PAGES,
PLEASE CALL 617-439-2676, AS SOON AS POSSIBLE

FOR NUTTER MCCLENNEN & FISH LLP USE ONLY

**PROPOSED AMENDMENTS TO THE CLAIMS
U.S. PATENT APPLICATION NO. 10/047,204**

1. (Previously Presented) An implantable shunt device, comprising:
a primary catheter having a connecting end, an open end, and an inner lumen extending therebetween; and
a plurality of secondary catheters coupled to one another and extending from the connecting end of the primary catheter, each secondary catheter having a fluid passageway formed therein in fluid communication with the inner lumen of the primary catheter, and at least one inwardly facing fluid entry port in fluid communication with the fluid passageway.
2. (Original) The implantable shunt device of claim 1, wherein the plurality of secondary catheters have a combined nominal outer diameter that is substantially the same as or less than an outer diameter of the primary catheter.
3. (Original) The implantable shunt device of claim 1, wherein the connecting end of the primary catheter includes an end cap having a plurality of bores extending into the inner lumen, each bore being adapted to receive a secondary catheter.
4. (Original) The implantable shunt device of claim 1, wherein the plurality of secondary catheters are formed integrally with the primary catheter.
5. (Original) The implantable shunt device of claim 1, wherein the plurality of secondary catheters are intertwined.
6. (Original) The implantable shunt device of claim 1, further comprising at least one support bracket disposed between each of the plurality of secondary catheters for securing the secondary catheters to each other.
7. (Original) The implantable shunt device of claim 6, wherein the at least one support bracket is formed from a biologically absorbable material.

8. (Original) The implantable shunt device of claim 6, wherein the at least one support bracket is adapted to position the secondary catheters at a distance apart from each other.
9. (Original) The implantable shunt device of claim 8, wherein the connecting end of the primary catheter includes a self-sealing valve adapted to receive a rigid stylet, the self-sealing valve being disposed between the inner lumen of the primary catheter and a region external to the inner lumen of the primary catheter.
10. (Original) The implantable shunt device of claim 9, wherein the at least one support bracket includes a central bore extending therethrough and adapted to receive the rigid stylet.
11. (Original) The implantable shunt device of claim 9, further comprising a rigid stylet removably disposed through the inner lumen of the primary catheter, the self-sealing valve in the connecting end of the primary catheter, between the plurality of secondary catheters, and through the at least one support bracket.
12. (Original) The implantable shunt device of claim 1, wherein each of the plurality of secondary catheters includes a proximal end mated to the connecting end of the primary catheter, and a sealed distal end.
13. (Original) The implantable shunt device of claim 12, further comprising a distal cap disposed around the distal end of each of the plurality of secondary catheters.
14. (Cancelled).
15. (Original) The implantable shunt device of claim 1, wherein the primary catheter and the plurality of secondary catheters are formed from a flexible material.
16. (Currently Amended) An implantable catheter, comprising:
 - an elongate trunk conduit having a first end, a second end, and an outer wall that defines an inner lumen; and
 - a plurality of branch conduits coupled to one another and extending from the second end of the elongate trunk conduit, each branch conduit including an inner lumen in fluid communication

with the inner lumen of the elongate trunk conduit, and at least one port extending into the inner lumen of the branch conduit;

wherein the catheter is configured to removably receive a rigid stylet through the inner lumen of the elongate trunk and between the plurality of branch conduits, and wherein a distal end of the plurality of branch conduits are connected by an end cap that is adapted to seat a distal end of the rigid stylet.

17. (Original) The implantable catheter of claim 16, wherein each of the plurality of branch conduits has a generally elongate cylindrical shape and includes an open proximal end mated to the elongate trunk conduit, and a closed distal end.

18. (Original) The implantable catheter of claim 16, wherein the second end of the elongate trunk conduit includes a self-sealing valve adapted to receive a rigid stylet and communicating between the inner lumen and a region external to the inner lumen.

19. (Original) The implantable catheter of claim 16, wherein the plurality of branch conduits are radially positioned at a distance apart from one another, and wherein the at least one port is disposed on an inwardly facing portion of each of the branch conduits.

20. (Previously Presented) The implantable catheter of claim 19, further comprising at least one connector bracket disposed between each of the plurality of branch conduits and adapted to maintain the branch conduits at a distance apart from each other.

21. (Original) The implantable catheter of claim 16, wherein the elongate trunk conduit and the plurality of branch conduits are formed from a flexible material.

22. (Original) The implantable catheter of claim 16, wherein the catheter includes three branch conduits.

23. (Previously Presented) The implantable catheter of claim 20, wherein the at least one connector bracket includes a central port formed therethrough for receiving a rigid stylet.

24. (Previously Presented) An implantable catheter, comprising:

a primary catheter having an inner lumen extending therethrough;

a plurality of secondary catheters extending from the primary catheter and maintained at a fixed distance apart from one another at a plurality of distinct locations along a length thereof, each secondary catheter including at least one inlet port formed therein and extending into an inner lumen extending therethrough and in fluid communication with the inner lumen in the primary catheter.

25. (Previously Presented) The implantable catheter of claim 24, wherein the at least one inlet port formed on the plurality of secondary catheters are formed on an inwardly facing surface of the secondary catheters such that the inlet ports are in facing relationship with one another.

26. (Previously Presented) The implantable catheter of claim 24, further comprising a plurality of support brackets mated to the plurality of secondary catheters for maintaining the catheters at a fixed distance apart from one another at a plurality of distinct locations along the length of the secondary catheters.

27. (Previously Presented) The implantable catheter of claim 24, further comprising a rigid stylet extending through the inner lumen formed in the primary catheter and extending between each of the plurality of secondary catheters.
